

Findings Summary

The investigation identified a customer facing failure in the vehicle insurance renewal workflow, characterized by blank and overlapping modal dialogs that prevented further progression. The issue was reproducible across multiple browsers and devices, indicating that it was unlikely to be environment specific. Browser console analysis revealed runtime JavaScript exceptions and dependency related failures occurring during the renewal process. Based on the observed behavior, the issue appeared to be associated with frontend error handling, modal rendering, and runtime execution failures. Detailed evidence, technical hypotheses, and recommended remediation strategies are provided in the accompanying presentation.
